

Advanced access control solution for leading global IT provider

Whom do you call to secure 20,000 sqm, six floors, 5000 staff members, and hundreds of visitors?

When faced with the dilemma, FPT Software trusted only the leading company Rosslare to secure their premises with top-of-the-line readers and controllers.

When FPT Software recently integrated its new premises in Danang City, they searched for a provider that would understand the complexity of its 6-floor, 20,000 sqm campus. They naturally turned to our partner Khai An Co., Ltd, known for providing Rosslare's leading technology in the area.

In their high-traffic environment, with over 5000 staff members on-premises, in addition to their customers, visitors, and partners, FPT Software required a top-of-the-line access control system that could manage and secure their complex vulnerabilities. The system needs to limit access to the campus, buildings, rooms, facilities, and physical assets to authorized personnel while monitoring and reporting the staff's and individuals' access to the restricted business locations and secured areas. Furthermore, it must be integrated with the fire alarm system that operates a pre-defined group of doors that will automatically be opened in an emergency. Finally, due to the complex and dynamic nature of the security task, the required access control system needs to be highly versatile while easy to use, allowing maintenance of pre-defined levels of security on a single platform.

About FPT Software

Established in 1999, FPT Software is a globally leading technology and IT services & solutions provider headquartered in Vietnam, with 54,000 employees in 28 countries. With international expertise spanning over a quarter of a century, FPT is a pioneer in digital transformation, delivering world-class services to over 1000 clients globally.

Enter Rosslare's AxTraxNG as the central access control platform, guaranteeing a system that is easily manageable while answering the complexity of the security and access control policy. Comprised of AC-215IP networked Controllers and AY-M26 Mifare Classic Sector Readers, the front end of their premises is highly secured by the proprietary set of readers and cards, which have been programmed with their sector keys. To increase security and prevent breaches, dual authentication is required for their high-value assets, such as the data centers, implemented with the deployment of AYC-W6500 readers. With over 200 panels to secure, control and manage, and the forecast of another 200 odd access points, FPT Software is satisfied with the state-of-the-art access control system implemented and confident they will continue with Rosslare's constantly expanding line of hardware, and software offers for their future expansion.
